## Product Overview

These sealed and rugged displays have 3 illuminated keys and a 60mm x 33mm screen.

- 128 x 64 dot graphic display or character display with black characters on white background
- Illuminated keys under software control ( on / off / flashing )
- Screen only version available if keys not required
- Extreme version available with higher environmental spec.

Install into a panel in a ¼ DIN cutout or from the rear of the panel using the fixing kit (order separately)

Connect to host via mini USB. The display uses an HID-compliant device interface to communicate with the host

A host application must be written to send content to the display, using the display control functions.

These functions are all listed in the API and the use of these is illustrated with code examples.

Download the following from [www.storm-interface.com/downloads](http://www.storm-interface.com/downloads) :-

- PC based Configuration Utility
- Object Libraries for Windows ( XP onwards) & Linux (Ubuntu)
- API Source Code (contact sales@storm-interface.com for source code requests )

## Product Range

		Character Display	Graphic Display
Screen with 3 Keys	Industrial	USB 3 key 4x20 char display IP54, 0°C to 60°C Impact 5J. Vibration& Shock IEC721-5M3  <b>Part Number 5103-000</b>	USB 3 key graphic display IP54, 0°C to 60°C Impact 5J. Vibration& Shock IEC721-5M3  <b>Part Number 5103-100</b>
	Extreme	USB 3 key 4x20 char display IP65,-20°C to 70°C Impact 10J. Vibration& Shock IEC721-6M3  <b>Part Number 5103-010</b>	USB 3 key graphic display IP65, -20°C to 70°C Impact 10J. Vibration& Shock IEC721-6M3  <b>Part Number 5103-110</b>
Screen only	Industrial	USB 4x20 char display IP54, 0°C to 60°C Impact 5J. Vibration& Shock IEC721-5M3  <b>Part Number 5100-000</b>	USB graphic display IP54, 0°C to 60°C Impact 5J. Vibration& Shock IEC721-5M3  <b>Part Number 5100-100</b>
	Extreme	USB 4x20 char display IP65, -20°C to 70°C Impact 10J. Vibration& Shock IEC721-6M3  <b>Part Number 5100-010</b>	USB graphic display IP65, -20°C to 70°C Impact 10J. Vibration& Shock IEC721-6M3  <b>Part Number 5100-110</b>
Please note that if ordering from broadline distribution there will be an additional suffix at the end of the part number. This is for distributor labelling purposes only.			
Accessories	Fitting Kit with panel clips, fixings, underpanel gasket, replacement seal <b>Part Number 5100-FK0</b>  USB Cable 1m, USB A to 90 degree USB mini-B <b>Part Number 4500-01</b>

## Functions

- The USB Display uses a USB HID-Compliant device interface to communicate with the host.
- The graphic LCD is 128 pixels by 64 pixels, with backlight, contrast level, and white on black capability.
- 3 Illuminated keys are under software control – on, off and flashing.
- The character LCD has three fixed fonts included
  - 6 by 8, this will give 8 lines by 20 characters , and
  - 6 by 16, this will give 4 lines by 20 characters.

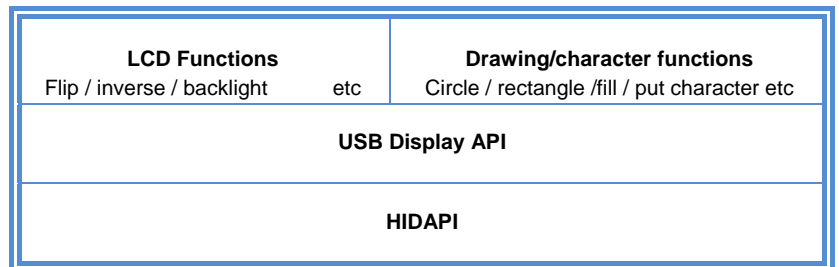

```
!"#$%&'()*+,-.\0123456789:;<=>?@
ABCDEFGHIJKLMNOPQRSTUVWXYZ[^_`abcdefghijklmnopqrstuvwxyz{|}~
```

- 26 by 64, this allows for 4 characters to be displayed 0123456789 , . : ° ±
- Four user definable Icons (up to 128 By 64) and any one of them can be setup as a splash screen.
- A host utility will be supplied to configure the unit, including downloading of the Icons.
- Field upgradeable via the utility.
- The host API allows access to following functions:
 

Set Pixel	Write Character	Write Character String
Draw Circle	Fill Circle	Draw rectangle
Fill Rectangle	Draw bitmap directly to LCD	Load Icons
Draw bargraph.	Draw line.	
- Each button when pressed will output a fixed key code.
- The Icons can be designed using Microsoft Paint™.
- The utility will allow the user to preview the Icon before loading to the USB display.

The USB display uses USB for communicating with the host. It also includes an HID-datapipe back-channel. One of the advantages of using this implementation using only HID interfaces is that no drivers are required on host system.

Basic architecture of the USB display :

## Ratings & Performance

Overall Dimensions	102mm x 102mm x 32mm
Packed Dims	125mm x 110 mm x 40mm, 203grams (Screen only version is 193 grams)
Connection	mini-USB socket (locking type)

<i>Environmental</i>	<i>Industrial Version</i>	<i>Extreme Version</i>
Operational temperature	0°C to +60°C	-20°C to +70°C
Vibration/ shock IEC721	5M3	6M3
Impact Rating	5J	10J
Sealing	IP54	IP65

Storage temperature	-20°C to +70°C
Humidity	10% to 90% non-condensing
Insulation resistance	50Mohms (min)
Breakdown voltage	500V a.c. (60 secs)
Operating voltage	5V +/- 5% (USB) – must only be used with SELV circuit.
Operating current	20mA (excluding key illumination current)

Safety	EU Low Voltage Directive	EN60950
EMC:	Emissions and Immunity:	FCC part 15B Class B EN55022, EN55024
	ESD: Up to +/- 15kV air discharge, +/- 7.5kV contact discharge	
EU RoHS	Compliant	
WEEE Directive	Compliant	

## Panel Cutout Drawings

### ¼ DIN

### Underpanel

Recommended panel thickness 1.6mm – 4mm s/s

Use M3 x 12mm or equivalent weld studs

## Installation into a ¼ DIN cutout

1. Fit the M4 nuts and screws to the brackets. Allow the screw to protrude to touch the panel

2. Fit the unit into the panel using 4 brackets

3. Tighten the M3 screws ( #1 PZ ) to attach each bracket to the rear of the unit.

4. Tighten the M4 screws ( #2 PZ ) to pull the unit down to the panel surface

5. Remove the protective film from the screen and connect your USB cable  
If additional cable securing is required then use a nylon tiewrap as shown

## Installation Underpanel

1. Prepare panel with studs M3 x 12mm (or equivalent 6-32 UNC)
2. Place the foam gasket around the display front

3. Fit the unit into the cutout – one bracket goes over each weld stud.

4. Fit a nut over each weld stud and tighten down

5. Remove the protective film from the screen and connect your USB cable  
If additional cable securing is required then use a nylon tie-wrap as shown

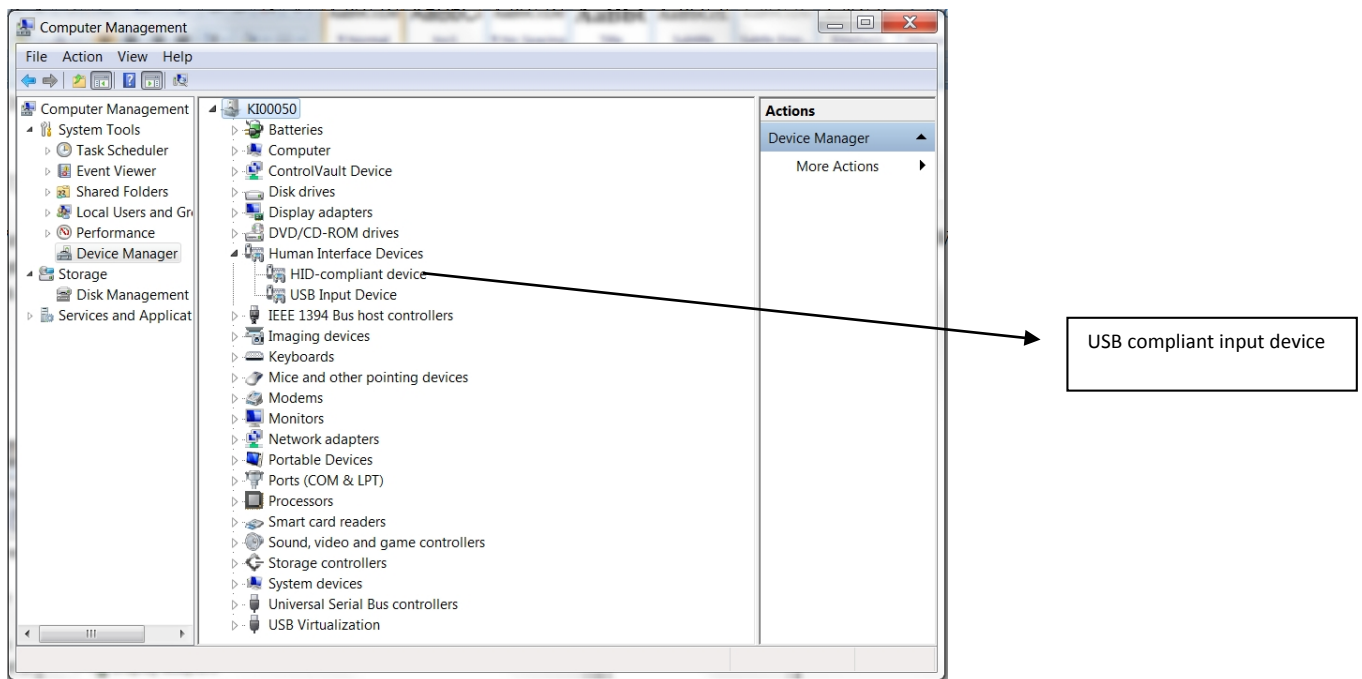

## Using the USB Display

On power up the USB display will perform basic self test and then proceed to display an initial splash screen. The default is the “Storm” logo, customers can customise this splash screen using the software utility, see below for more detailed description.

Once the unit is connected to PC, Windows will detect the USB display as follows :-

When connected to a PC, the USB Display should be detected by the operating system and enumerated without drivers. Windows shows one device in the Device Manager : USB Human Interface Device: Compliant device

The USB Configuration Utility is supplied in order that the user can perform firmware updates, and upload icons to the USB display.

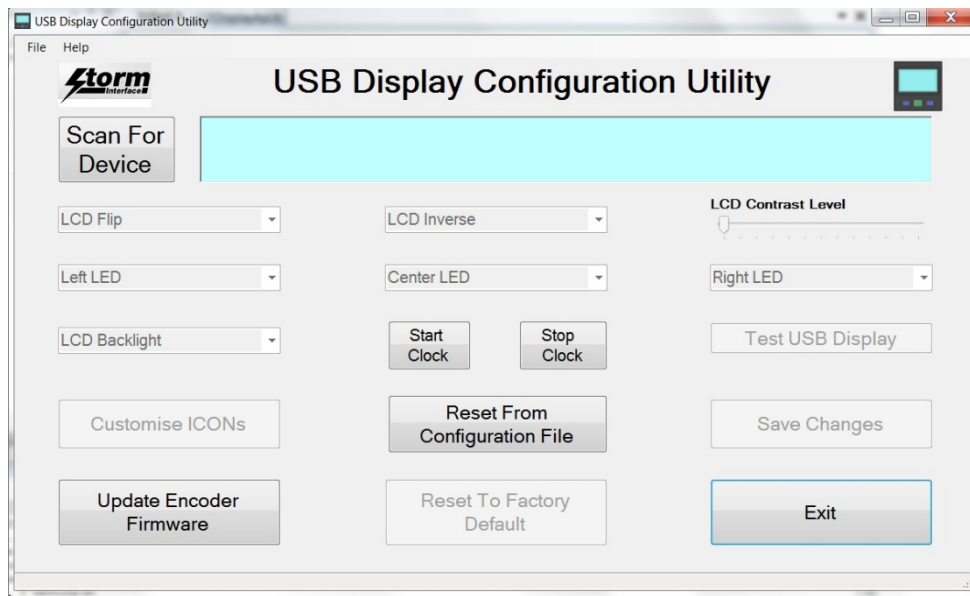

Download the Configuration Utility for free from [www.storm-interface.com/downloads](http://www.storm-interface.com/downloads)

All other functions in the Configuration Utility are also available in the API.

## Controlling the USB Display with the Configuration Utility

Launch the application and it will display the following screen:

Before loading the form it initially detects the encoder using the VID/PID and if found it sends a device status message. If all successful then all the buttons are enabled. If not then they will all be disabled except for “Re-Scan” and “Exit”.

Buttons will be disabled/enabled depending on options installed.

Options Installed	Buttons disabled
3 keys + 4/8line character only	Customise ICONs
3 keys + 4/8line character + bitmap	None
No keys + 4/8line character only	All LEDs + Customise ICONs
No keys + 4/8line character + bitmap	All LEDs

- Note: Manufacturer and Product strings are recovered from the USB stack. The USB ID in our product is Vendor ID: 0x2047 Product ID: 0x0922.

Firmware version is recovered from the encoder.

Once a configuration is selected and accepted by the USB Display then that information is stored in volatile memory of the unit. So if the user has not written to flash (using “Save Changes”) then powering down/up the encoder, that configuration will be lost.

## Configuration Utility Functions

### **LCD Flip** (180° rotation)

This will set the default value of how the lcd data will be displayed.

LCD Flip – No (Factory Default)

LCD Flip – Yes

### **LCD Inverse**

This will invert the colour of the pixels.

LCD Inverse – No (Factory Default)

LCD Inverse – Yes

### **LCD Contrast Level**

This will set the contrast level of LCD display.

LCD Contrast Level – 0

LCD Contrast Level – 1

LCD Contrast Level – 10 (Factory Default)

LCD Contrast Level – 20

### **LCD Backlight**

This will set the default value of the backlight.

LCD Backlight – On (Factory Default)

LCD Backlight – Off

LCD Backlight – Flashing

### **LEDs**

If unit has the three keys installed then the LEDs can be controlled via software individually as follows:

#### **Left LED**

Left LED – Off (Factory Default)

Left LED – On

Left LED - Flashing

#### **Right LED**

Right LED – Off (Factory Default)

Right LED – On

Right LED - Flashing

#### **Centre LED**

Centre LED – Off (Factory Default)

Centre LED – On

Centre LED – Flashing

### **Test USB Display**

This will execute a self test mode on the encoder.

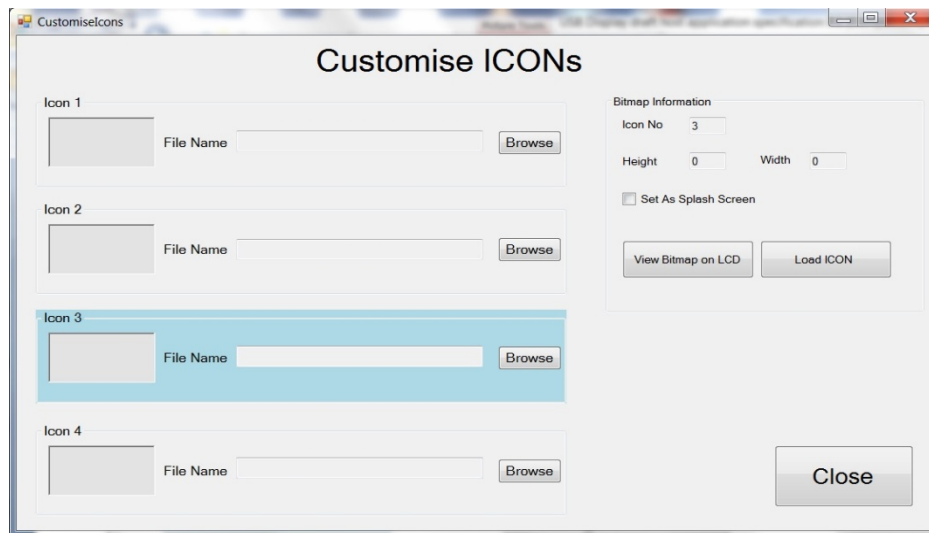

- Show a test pattern on LCD display
- Display circles, rectangle etc.,
- Test keys on unit.

## Customise Bitmaps

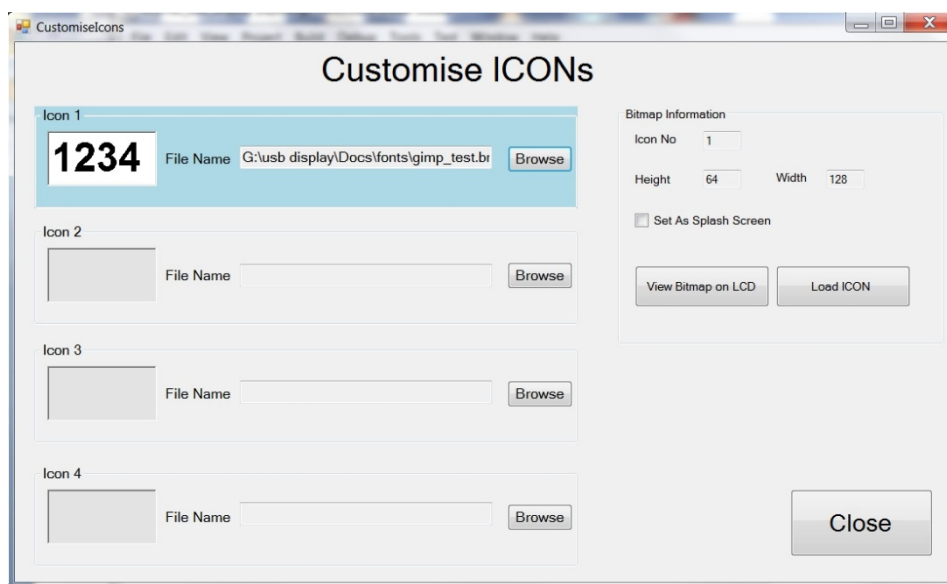

The USB display supports up to four downloadable bitmaps (128 by 64).

The ICONs must be first designed using Paint or any other package that supports the monochrome paint format (i.e. 1bpp format).

Select an Icon position eg Icon 3 and click on “Browse” button. This will open explorer : navigate to your bitmap file and click on “Open”.

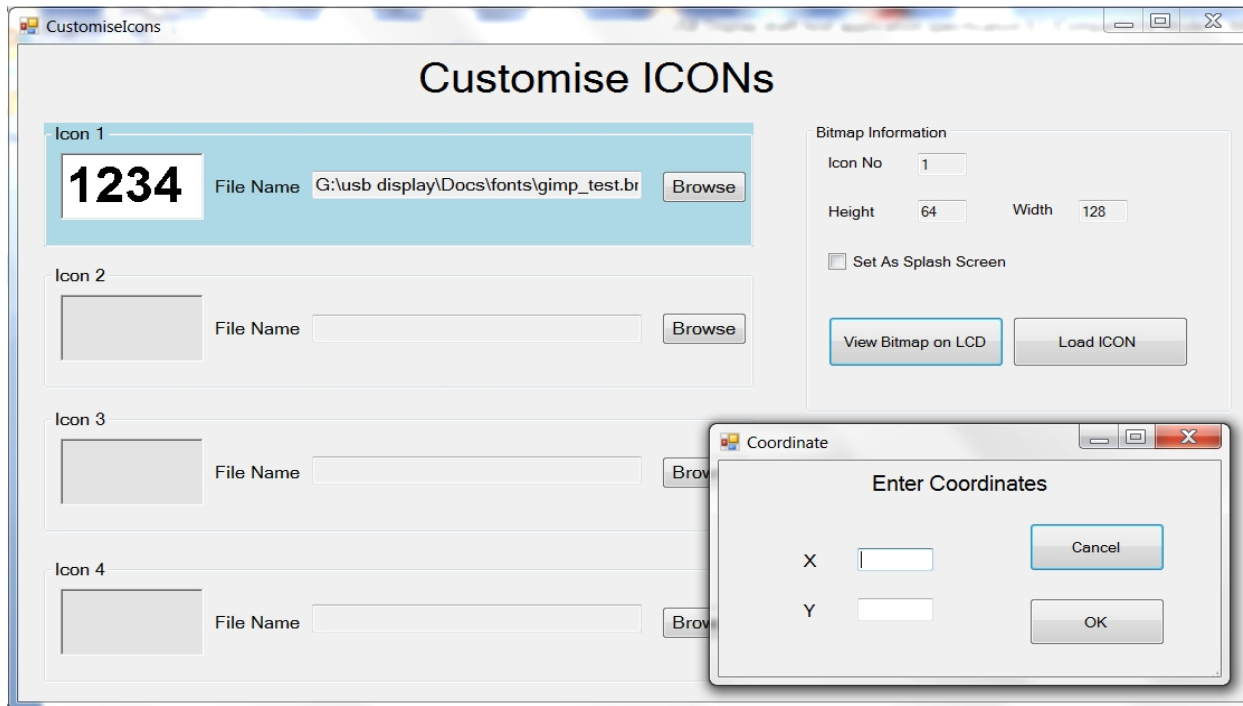

The ICON will be displayed in the icon picture box

On right hand side there is information about the ICON, height, width, icon number and if user wants to use this as the splash icon, when the unit starts up. Only one icon can be set as splash screen.

Now to view the icon on the LCD unit click on “View bitmap on LCD”. It will prompt you to enter X, Y coordinates. The ICON can be placed anywhere on the LCD screen.

Clicking on “OK”, the utility will send the ICON to the USB Display.

Once you are happy with the ICON then you can load the ICON into non volatile memory by clicking on “Load ICON”.

The ICON will be placed in appropriate ICON value on USB display. You can also select one of the icons to be used as a splash screen.

### Save Changes

All configurations are written to volatile memory. So if after modifying and the user switches off the encoder then next time the encoder is powered on, it will revert back to previous configuration data. To save the modified data in non volatile memory, click on “Save Changes” button. All the information is also stored in configuration file.

### Reset To Factory Default

Clicking on “Factory Default”, and then disconnecting & reconnecting the USB display will reset the unit to the factory default values.

### Reset From Configuration File

Clicking on “Reset From Configuration File” will load the values from the last saved configuration i.e when you pressed “Save Changes”.

### Update Firmware

This option allows the user to update the firmware on the USB display unit. (Firmware only available on request)

## Interface Specifications

### Introduction

This document describes the interface specification for the USB Display unit. It will provide details on how the display unit can be configured and controlled from a host that has USB capabilities.

### USB Display Device Communications

USB Display uses the ASCII/binary Message format described below. Every message that is sent from a host should be acknowledged with the control byte ACK (0x06). A retransmission should be initiated if an NAK (0x15) is received or if no acknowledge is received at all.

#### Message Formats

A	Alpha character, 'A'-'Z' and 'a' - 'z'
C	Control character one byte in length.
H	Hexadecimal characters, '0'-'9', 'A'-'F'
N	Numeric character, '0'-'9'
S	Special characters, entire character set 0x00 - 0xFF

#### ASCII Message Format

		Message Field	Type	Length	Description
STX	1	STX	C	1	Control character Start of Text = 0x02
MID	2	Message Id	H	2	Defines the type of message and format of the data field
DL	3	Data Length	H	2	Hexadecimal value represented in ASCII defines the number of bytes in the data field. '00' to 'FF'. Maximum data field size is 256 bytes.
DF	4	Data Field	S	var	In binary format
ETX	5	ETX	C	1	Control character ETX = 0x03

LRC	6	LRC	C	1	Longitudinal Redundancy Check Digit, calculated on all previous data including STX
-----	---	-----	---	---	--

## Fonts

Following fonts are supported by the USB display.

0	FONTS 6 by 8
1	FONTS 6 by 16
2	Reserved
3	FONTS 26 by 64

Note: The following fonts have been defined:

Font 6 by 8 and Font 6 by 16:

Space ! " # \$ % & ' ( ) \* + , - . / 0 1 2 3 4 5 6 7 8 9 : ; < = > ? @ A B C D E F G H  
I J K L M N O P Q R S T U V W X Y Z [ \ ] ^ \_ ` a b c d e f g h i j k l m n o p q r s  
t u v w x y z { | } ~

Font 26 by 64:

0 1 2 3 4 5 6 7 8 9 : , . - + ± °

and following codes are mapped for:

± is mapped to character code !

° is mapped to character code ~

*Message Id Definitions*

Here is a general table describing the message Ids, more detailed descriptions for each message Id follows. When a message is one way only, the Message Id. is the same for both the message and response.

<b>Id.</b>		<b>Message</b>	<b>Description</b>
01	dsr	Device Status Request	Host To USB Display – Output the firmware version and all currently selected parameters
02	lled	LED Left	Host To USB Display – 0 – off, 1 – on, 2 – flashing
03	rled	LED Right	Host To USB Display – 0 – off, 1 – on, 2 – flashing
04	cled	LED Center	Host To USB Display – 0 – off, 1 – on, 2 – flashing
05	cls	LCD Clear Screen	Host To USB Display – Clears LCD screen buffer
06	dsp	LCD Display	Host To USB Display – Displays LCD Screen Buffer
07	init	LCD Init	Host To USB Display – Initializes LCD unit
08	sf	LCD Screen Flip	Host To USB Display – 0 – normal, 1 – flips
09	si	LCD Inverse Display	Host To USB Display – 0 – Normal, 1 – Inverse
10	sp	LCD Display Test Pattern	Host To USB Display – Displays a test pattern
11	scl	LCD set Contrast	Host To USB Display – Sets contrast: 0 – 10 levels
12	sb	LCD Backlight	Host To USB Display – 0 – off, 1 – on
13	rsv	Reserved	Reserved
14	save	Write to default	Host To USB Display – Display writes configuration data from ram to flash.
15	rst	Reset to factory default	Host To USB Display – Reset device back to factory default
16	lfw	Load Firmware	Host To USB Display – Sets the Display to detect the device loader for firmware loading
17	dl	Draw Line	Host To USB Display – Draws line between two points
18	dr	Draw/Fill Rectangle	Host To USB Display – Command to draw and/or fill rectangle
19	dc	Draw/Fill Circle	Host To USB Display – Command to draw and/or fill circle
20	dbm	Draw Bitmap	Host To USB Display – Writes bitmap in screen buffer
21	pc	Put char	Host To USB Display – Command to write character in display buffer – See fonts
22	ps	Put String	Host To USB Display – Command to write a character string in display buffer
23	spx	Set Pixel	Host To USB Display – Command to write a single pixel with specified colour
24	rsv	RESERVED	RESERVED
25	lbn	Load Bit map	Host To USB Display – Load bitmap and stores it in flash. 0 – 3 (allows 4 bitmap)
26	dif	Draw Bitmap from Flash	Host To USB Display – Writes bitmap from flash to display buffer
27	ssv	Splash Screen	Host To USB Display – Enables/Disables display of splash screen
28	dbg	Draw Bar Graph	Host To USB Display – Writes bar graph data to screen buffer.
29	okey	Output key code	USB Display to Host – Fixed USB code will be sent out. 50H (left), 4FH(right), 58H(Enter)
30	Rsv	Reserved	Reserved
31	dchar	Display Character	Host To USB Display – Command to write and display character in display buffer – See fonts

32	dstr	Display String	Host To USB Display – Command to write and display string in display buffer – See fonts
33	gtemp	Get Temperature	Host To USB Display – Command to get the temperature of the unit.
34	Ers	Enable Screen Refresh	Host To USB Display – To enable screen refresh, allows screen command to display screen buffer without calling LCD Display. This increases speed
35	Mul	Multiple Command	Host To USB Display – To allow multiple commands to be sent to 5100 in USB buffer

### Error Code

Every response message contains one of the following error codes:

00	No error
01	Command not recognized
02	Command not support at this stage
03	Parameter not supported
04	Hardware fault

### Protocol

The developer must also make sure that following USB headers are included when data packets are sent/received to/from host. Note: all numbers are in hexadecimal.

(KRID) <Keymat Report ID> - 3fH

(USBLEN) <USB Report LEN> - Our maximum size is set to 64 bytes (40H)

As an example to sent Device Status message to USB Display, below is message format that is sent/received.

Host

USB Display

<KRID><40><02><30><31><30><30><03><00><..pad with xx upto 40> -->

<< KRID><01><06>

<< KRID><18><02><30><31><31><31><00><00><00><08><01><01><01><01><00><16><V><1><.><0>< 20><20><20><03><47>

Explanation of each message:

Message 1, from Host to USB Display: <KRID><40><02><30><31><30><30><03><00><..pad with 0 upto 40h>

- <KRID> - Keymat report ID – always 3f
- <40> - USB report length (USBRLLEN)
- <02> - STX
- <30><31> - Message ID, ASCII HEX, , eg. Device Status (01)
- <30><30> - Data length, ASCII HEX, eg. 0 bytes
- <03> - ETX
- <00> - LRC – This is lrc checksum from <STX> to <ETX>
- <..pad with 0 upto 40h> - Padded with xx upto 40.

Message 2, from USB Display to Host: <KRID><01><06>

- <KRID> - Keymat report ID – always 3f
- <01> - USB report length
- <06> - ACK – acknowledgement that USB display has received the message

Message 3, from USB Display to Host: <KRID><18><02><30><31><31><31><00><00><00><08><01><01><01><01><00><16><V><1><.><0><20><20><20><03><47>

- <KRID> - Keymat report ID – always 3f
- <18> - USB report length (USBRLLEN)
- <02> - STX
- <30><31> - Device Status (01) Message ID

- <31><31> - Data length of 11 (hex) bytes, or 17 decimal
- <00> - Error Code (EC)
- <00> - Flip Mode
- <00> - Inverse Mode
- <08> - Contrast level
- <01> - Backlight
- <01> - Left Led
- <01> - Right Led
- <01> - Center Led
- <00> - Icon No for Splash Screen
- <16> - Reserved
- <V><1><. ><0>< 20><20><20> - Firmware Version Number
- <03> - ETX
- <47> - LRC – This is lrc checksum from <STX> to <ETX>

**Device Status (01)**

Host sends this message to USB Display to request the status of the Display.

**USB Display Status Response**

Secure device sends this message to Host in response to the Device Status message.

		Data Field	Type	Length	Description
ec	1	Error Code	H	2	
sf	2	Screen flipped status	N	1	0 – normal, 1 – flipped
si	3	Screen Inverse Status	N	1	0 – normal , 1 – inversed
cl	4	Contrast Level	N	1	0 – 9
bl	5	Backlight	N	1	0 – off, 1 – on, 2 - Flashing
lled	6	Left LED	N	1	0 – off, 1 – on, 2 - flashing
rled	7	Right LED	N	1	0 – off, 1 – on, 2 - flashing
cled	8	Center LED	N	1	0 – off, 1 – on, 2 - flashing
icon	9	Icon no – Splash	N	1	0-3 – Indicates which icon is set as splash screen
rsv	10	Reserved	N	1	Reserved (actually a code to identify model)
fwv	11	Firmware Version	ANS	Upto 20	Left justified, if Firmware Version is less than 20 then just add enough spaces after the Firmware Version until this field is completed, for instance, “123456” becomes: “123456 “

Host sends this message to request information from the USB Display.

**Notes.**

The Message ID is 2 bytes, an ASCII HEX pair, eg. [0x30 0x31] which is ‘01’ decimal

The length field is 2 bytes, an ASCII HEX pair.

In this example the data field is null, so the length is zero (0x30 0x30)

So the whole message is [0x30, 0x31, 0x30, 0x30]

Host message is bracketed by [STX] message [ETX][LRC]

Which in turn is bracketed by [3F][40] host message [padded as required to 64 char], the keymat report id/frame.

*LED left command (02)*

Host sends this message to control the left button led

		Data Field	Type	Length	Description
lled	1	LED left	N	1	0 – off, 1 – on, 2 - flashing

**LED left Command Response**

		Data Field	Type	Length	Description
ec	1	Error Code	H	2	

*LED Right command (03)*

Host sends this message to control the right button led

		Data Field	Type	Length	Description
rled	1	LED Right	N	1	0 – off, 1 – on, 2 - flashing

**LED right Command Response**

		Data Field	Type	Length	Description
ec	1	Error Code	H	2	

*LED Centre command (04)*

Host sends this message to control the Centre button led

		Data Field	Type	Length	Description
cled	1	LED centre	N	1	0 – off, 1 – on, 2 - flashing

**LED Centre Command Response**

		Data Field	Type	Length	Description
ec	1	Error Code	H	2	

*LCD Clear Screen command (05)*

Host sends this message to clear the LCD screen buffer

**LCD Clear Screen Command Response**

		Data Field	Type	Length	Description
ec	1	Error Code	H	2	

LCD Display command (06)

Host sends this message to display the LCD buffer.

LCD Display Command Response

		Data Field	Type	Length	Description
ec	1	Error Code	H	2	

LCD Init command (07)

Host sends this message to initialise the lcd unit

LCD Init Command Response

		Data Field	Type	Length	Description
ec	1	Error Code	H	2	

*LCD Screen Flip command (08)*

Host sends this message to Flip the LCD screen

		Data Field	Type	Length	Description
sf	1	LCD Flip	N	1	0 – normal, 1 - flipped

**LCD Screen Flip Command Response**

		Data Field	Type	Length	Description
ec	1	Error Code	H	2	

*LCD Inverse command (09)*

Host sends this message to Inverse the LCD screen

		Data Field	Type	Length	Description
si	1	LCD Inverse	N	1	0 – normal, 1 - Inverse

**LCD Inverse Command Response**

		Data Field	Type	Length	Description
ec	1	Error Code	H	2	

*LCD display Test Pattern command (10)*

Host sends this message to display test pattern

**LCD Display Test Pattern Command Response**

		Data Field	Type	Length	Description
ec	1	Error Code	H	2	

*LCD Set Contrast command (11)*

Host sends this message to set LCD units contrast level

		Data Field	Type	Length	Description
cl	1	LCD Set Contrast	N	1	0 – 9

**LCD Set Contrast Level Command Response**

		Data Field	Type	Length	Description
ec	1	Error Code	H	2	

*LCD Set Backlight command (12)*

Host sends this message to Set LCD Backlight

		Data Field	Type	Length	Description
bl	1	LCD Backlight	N	1	0 – off, 1 – on, 2- flashing

**LCD Backlight Command Response**

		Data Field	Type	Length	Description
ec	1	Error Code	H	2	

*Write Config Data To Flash command (14)*

Host sends this command to request the USB Display to write the configuration data from RAM to FLASH. This command has no data associated with it.

RAM to FLASH command **Response**

		Data Field	Type	Length	Description
ec	1	Error Code	H	2	

*Reset To Factory Default command (15)*

Host sends this command to request the USB Display to reset parameters back to factory default. This command has no data associated with it.

Reset To Factory Default **Response**

		Data Field	Type	Length	Description
ec	1	Error Code	H	2	

*Load Firmware Command (16)*

Host sends this command to request the USB Display to start downloader

Enable BSL command **Response**

		Data Field	Type	Length	Description
ec	1	Error Code	H	2	

*LCD Draw Line command (17)*

Host sends this message to Draw line in LCD Screen Buffer

		Data Field	Type	Length	Description
dl	1	LCD Draw Line	H	5	x1, y1, x2, y2, Colour (col) (X1,X2, Y1, Y2 are Cordinate) Colour can be 0 or 1

**LCD Inverse Command Response**

		Data Field	Type	Length	Description
ec	1	Error Code	H	2	

*LCD Draw Rectangle or Fill command (18)*

Host sends this message to Draw Rectangle in LCD Screen Buffer

		Data Field	Type	Length	Description
dr	1	LCD Draw Rectangle	H	6	Fill,x, x, Width(w), Height(h), Colour(col) (X, Y are Coordinate) Colour can be 0 or 1. Fill (0 – no fill, 1 – Fill)

**LCD Inverse Command Response**

	Data Field	Type	Length	Description
1	Error Code	H	2	

*LCD Draw or Fill Circle command (19)*

Host sends this message to Draw Circle or Fill Circle in LCD Screen Buffer

		Data Field	Type	Length	Description
dc	1	LCD Draw Circle	SN	5	Fill, x, y, Radius(r),Colour(col) (X, Y are Cordinate) Colour can be 0 or 1. Fill – 0 - no fill, 1 – fill

**LCD Inverse Command Response**

ec		Data Field	Type	Length	Description
	1	Error Code	H	2	

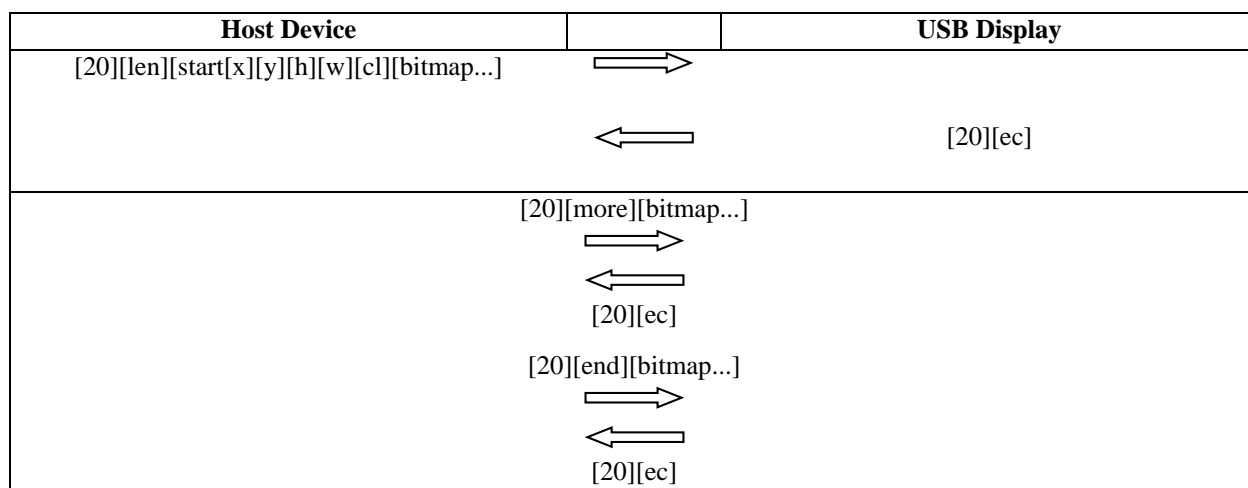

*LCD Draw Bitmap From Host command (20)*

Host sends this message to Load bitmap from Host in LCD Screen Buffer

		Data Field	Type	Length	Description
dbm	1	LCD Bitmap	SN	Var	Progress, X, Y, height, width, Colour(col), <bitmap>. Bitmap can be upto 1024 bytes. If only partial bitmap, other values in screen buffer are not modified. As the max buffer allowed is 64 bytes per command, Progress – start (0), more(1), end(2). So as minimum you must have a start and end. Header is only applied for <start> and <more> and <end> should only be followed by data.

**LCD Draw Bitmap from Host Response**

		Data Field	Type	Length	Description
ec	1	Error Code	H	2	

*LCD Draw Character command (21)*

Host sends this message to Draw a character from set font to LCD Screen Buffer

		Data Field	Type	Length	Description
pc	1	LCD Display character	SN	5	x, line, Colour, character (X, Line are Cordinate), Font. Colour (col) can be 0 or 1. Character is ascii value from 0x20 to ???. Line is 0 to 7 for 6by8 font and 0 to 3 for 6by16 font.

**LCD Draw Character Command Response**

	Data Field	Type	Length	Description
1	Error Code	H	2	

*LCD Draw String of Characters command (22)*

Host sends this message to Draw String of characters in LCD Screen Buffer

		Data Field	Type	Length	Description
ps	1	LCD Display String Of Characters	AN	var	x, line, Colour(col), <Character String>, Font. (X, Line are Cordinate) Colour can be 0 or 1. Character String e.g. "Storm Interface". Font (see font table)

**LCD Inverse Command Response**

		Data Field	Type	Length	Description
ec	1	Error Code	H	2	

*LCD Set Pixel command (23)*

Host sends this message to Set Pixel at specified location in LCD Screen Buffer

		Data Field	Type	Length	Description
spx	1	LCD Set Pixel	SN	5	x, y, Colour(col) (X, Y are Cordinate) Colour can be 0 or 1.

**LCD Set Pixel Command Response**

		Data Field	Type	Length	Description
ec	1	Error Code	H	2	

*Load Bitmap command (25)*

Host sends this message to Load bitmap from host to Flash

		Data Field	Type	Length	Description
lbn	1	Load Bitmap	SN	Var (upto 1024 bytes)	Progress (pg), Location(loc), height, width Bitmap data. Can only be up to 1024 bytes as screen size is 128 X 64 bits. Location – 0 – 3. Allow four bit maps and location 0 will be the splash screen. As the max buffer allowed is 64 bytes per command, Progress – start (0), more(1), end(2). So as minimum you must have a start and end. Header is only applied for <start> and <more> and <end> should only be followed by data.

**Load Bitmap Command Response**

		Data Field	Type	Length	Description
ec	1	Error Code	H	2	

*Draw Bitmap From Flash command (26)*

Host sends this message to Draws specified bitmap from Flash to LCD display buffer

		Data Field	Type	Length	Description
dff	1	Draw bitmap from Flash	SN	3	x, y, Location(loc) – 0 – 3. Allow four bit maps and location 0 will be the splash screen.

**Draw Bitmap from Flash Command Response**

		Data Field	Type	Length	Description
ec	1	Error Code	H	2	

*Manage Splash Screen command (27)*

Host sends this message to Enable/Disable the displaying of the splash screen. The value gets copied to volatile memory. This value needs to be saved to flash, this can be done by using the API write config data to flash (14). After enabling and next reboot the value will take effect.

		Data Field	Type	Length	Description
SS	1	Manage Splash Screen	SN	1	0 – enable screen 1 & 2, 1 – disable screen 1 & 2, 2 – disable screen 1, enable scrn 2, 3 – enable screen 1 and disable screen 2

**Manage Splash Screen Command Response**

		Data Field	Type	Length	Description
ec	1	Error Code	H	2	

*Draw Bargraph command (28)*

Host sends this message to Draw Bargraph in LCD screen buffer.

		Data Field	Type	Length	Description
dbg	1	Draw Bargraph	SN	SN	Direction,x, y, height(h), Width(w), Colour(col), Percentage fill(p), Direction (dir) – 0 – horizontal, 1 – vertical.

**Draw Bargraph Command Response**

		Data Field	Type	Length	Description
ec	1	Error Code	H	2	

*Key Press Code (29)*

USB Display sends appropriate key scan code to HOST when a key is pressed on keypad.

**Key press Code Type Response**

	Data Field	Type	Length	Description	
okey	1	Key press Code	H	1	Sends appropriate key code to host when keypad key is pressed.

*Reserved (30)*

*LCD Display Character command (31)*

Host sends this message to Display a character from set font to LCD Screen Buffer

	Data Field	Type	Length	Description
dchar	1 LCD Display character	SN	5	x, line, Colour, character (X, Line are Cordinate), Font. Colour (col) can be 0 or 1. Character is ascii value from 0x20 to ??. Line is 0 to 7 for 6by8 font and 0 to 3 for 6by16 font.

**LCD Display Character Command Response**

	Data Field	Type	Length	Description
1	Error Code	H	2	

*LCD Display String of Characters command (32)*

Host sends this message to Display String of characters in LCD Screen Buffer. This command also displays the string. This is to speed up the operation

		Data Field	Type	Length	Description
dstr	1	LCD Display String Of Characters	AN	var	x, line, Colour(col), <Character String>, Font. (X, Line are Coordinate) Colour can be 0 or 1. Character String e.g. "Storm Interface". Font (see font table)

**LCD Display String Command Response**

		Data Field	Type	Length	Description
ec	1	Error Code	H	2	

*Get Temperature command (33)*

Host sends this command to request the temperature of USB Display. This command has no data associated with it.

**Get Temperature Response**

		Data Field	Type	Length	Description
ec	1	Error Code + Temperature	H	2 + AN	The temperature will be sent out in ascii string

*Enable Screen Refresh (34)*

Host sends this command to enable screen refresh. This displays screen buffer for all display command like DisplayString etc, without calling LCD Display. This will increase screen refresh rate.

**Enable Screen Refresh Command Response**

		Data Field	Type	Length	Description
ec	1	Error Code	H	2	

*Send Multiple command (35)*

Host sends this command to enable multiple commands to be sent to the USB buffer. The host can first add all the commands to the USB buffer and then call Send Multiple Command.

		Data Field	Type	Length	Description
sm	1	Multiple commands	AN	var	Multiple command upto size of USB buffer – header info

**Send Multiple Command Response**

		Data Field	Type	Length	Description
ec	1	Error Code	H	2	

Notes.

The Message ID is 2 bytes, an ASCII HEX pair, eg. [0x32 0x33], which is 35 decimal

The length field is 2 bytes, an ASCII HEX pair, which is the total length of the commands

So the whole message is [0x32, 0x33, 0xxx, 0xxx, cmd1, cmd2 ..]

The Multiple Command data field consists of one or more commands, but limited to the following commands: Display String, Put String, Display Char, Put Char, Draw Line, Draw Circle, Draw Rectangle, Clear Screen.

Each command has same structure as above [Mid][Len][data]

The maximum total length of the commands is 55 bytes (still has to fit 64 bytes overall)

As usual the whole message is bracketed by [0x3F][0x40][STX] message [ETX][LRC]

## API Overview

The USB Display API Library is a library program which currently is tested on Windows (from XP and above) and Linux (Ubuntu) platform.

The Library is a middleware program between operating system and host application. The library encapsulates all the communication protocol and exposes a very simple API for host application.

This document is prepared for application developers who will implement a host application for the USB Display.

The USB Display API Library is a middleware application between USB Display Host application and USB Display system.

The USB display uses USB for communicating with the host. It includes an HID-compliant device . One of the advantages of using this implementation, which using only HID interfaces, is that no drivers are required on host system.

The protocol for communicating with host is described fully in the following pages. The basic architecture of the USB display API is shown below.

<b>LCD Functions</b> Flip / inverse / backlight etc	<b>Drawing/character functions</b> Circle / rectangle /fill / put character etc
<b>USB Display API</b>	
<b>HIDAPI</b>	

- USB Display API – The USBDisplayApi library allows for the host application to invoke USB display functions as listed above. The API encapsulates all the communications to USB and provides a simple API for the host application developers.
- HIDAPI - This is a third party library, which allows an application to interface with USB HID-Compliant devices on Windows, Linux, and Mac OS X. While it can be used to communicate with standard HID devices like keyboards, mice, and Joysticks, it is most useful with custom (Vendor-Defined) HID devices. This allows for host software to scan for the device using its VID/PID.

Libraries are provided for both the HIDAPI and USB display interface, so that it can be linked into the users host application. This exposes a well defined API for the host application.

The developer does not need to worry about the communication at low level. You can request source code for the implementation for library so it can be ported to your specific platform. Currently the library has been tested on Windows and Linux (Ubuntu) platform.

The API makes the following functions available to developers

see page

All Message Types.....	53

**Message Types**

This is referenced in below functions:

```
enum REQUEST_TYPE{           // message types

DEVICE_STATUS = 1,          ///Device status message
LED_LEFT,                   //< set led brightness
LED_RIGHT,                   //right led
LED_CENTER,                  //Center led
LCD_CLEAR_SCREEN,           //clears LCD display buffer
LCD_DISPLAY_SCREEN,         //displays whats in screen buffer
LCD_INIT,                    //inits LCD
LCD_SCREEN_FLIP,            //FLIPS LCD SCREEN
LCD_INVERSE,                 //INVERSE LCD
DISPLAY_TEST_PATTERN,       //displays test pattern
LCD_SET_CONTRAST,
LCD_BACKLIGHT,              //controls backlight
RESERVED,
WRITE_DEFAULT,              // Write defaults values from ram to flash
RESET_TO_FACTORY_DEFAULT,   // reset the setting to factory default
ENABLE_BSL,                  //start downloader
DRAW_LINE,
DRAW_RECTANGLE,
DRAW_CIRCLE,
DRAW_BITMAP_HOST,
PUT_CHAR,
PUT_STRING,
SET_PIXEL,
GET_PIXEL,
SET_BITMAP,
DRAW_BITMAP_FLASH,
MANAGE_SPLASH_SCREEN,
DRAW_BARGRAPH,
KEYPRESS,
DISPLAY_CHAR,
DISPLAY_STRING,
GET_TEMPERATURE,
ENABLE_SCREEN_REFRESH,
MULTIPLE_COMMAND,

}
```

## Draw Functions

This set of draw functions allows the developer to draw various shapes with a simple API. The screen size is 128 X 64 pixels.

The USB Display has dedicated screen buffer (128 X 64) and it is this screen buffer holds the pixel image, before it is transferred to the LCD display. This allows the developer to first build up a image and then display it using the LCDFunction (SCREEN\_DISPLAY) command.

The coordinates are referenced as shown above, with 0,0 (x,y) in top left hand corner.

## Character Fonts

The USB Display also has two full set of character fonts (6X8 and 6X16) with following characters:

<SPC>!\"#\$%&()\*+,-./0123456789:;<=>?@ABCDEFGHIJKLMNPOQRSTUVWXYZ[\]^\_`abcdefghijklmnopqrstuvwxyz{|}~

The above fonts have a border of 4 pixels at beginning and 4 pixels at end of line

The characters fonts are display with x coordinate and line number, as specified below:

FONT 6X8 - line 0 to 7  
FONT 6X16 - line 0 to 3

There is also special large font (26X64) but only a limited set of characters:

This font can only be specified with line as 0.

0123456789 - This are all defined as 26X64  
:,-+±° - This are all defined as 8X64

For the large fonts, following characters have been mapped:

~ will display °  
! will display ±

## DrawBargraph

This functions draws a bargraph with the supplied parameters. The bargraph can be drawn in vertical or horizontal direction.

For example to draw bargraph, which shows two bargraph, one horizontal and one vertical. The vertical shows with scale set to on (which gives 10 equal scales) and horizontal with no scaling.

In above example:

	Vertical Bargraph	Horizontal Bargraph
Direction	0	1
X	10	50
Y	4	4
W	50	30
H	30	50
Colour	1	1
Percentage Fill	20	66
Scale	1	0

### Parameters :

Direction	-	0 – vertical, 1 – horizontal
x, y	-	coordinates as shown above
w	-	width
h	-	height
colour	-	1 – black, 0 – white
percentageFill	-	Total percentage of rectangle to fill with colour.
Scale	-	1 – insert scaling, 0 – no scaling
timeToWait	-	maximum time to wait for command to complete

### Return Value:

True for success  
False for failure.

## Display String

This function displays a string of characters on USB Display. The USB Display will autowrap the string to next line if more than 20 characters are on a single line or on a carriage return.

In above example, displays a mixture of fonts line 0 and 1 is using FONT6X8 and line 4 and 7 using FONT6X16. Use this function instead of DrawString if speed is required to display the string. Using this function will display the string onto the USB display. Whereas, with DrawString, you need to follow it up LCDFunction(LCD\_DISPLAY\_SCREEN )

Note: the line spacing of fonts for FONT6X16 will be left to the developer.

### Parameters :

X	-	0 to 127
Line	-	0 to 7 (FONT6X8 and FONT6X16) and 0 (FONT26X64)
fontSelected	-	FONT6X8, FONT6X16 or FONT26X64
colour	-	1 – black, 0 – white
charString	-	Character string.
timeToWait	-	maximum time to wait for command to complete

### Return Value:

True for success  
False for failure.

```
///  
//\brief DisplayString - This functions formats and displays applied string of  
//characters and specified fonts at coordinates  
///  
//\Param - x (0 to 127)  
//\Param - line (0 to 7)  
//\Param - colour - 0 white 1 black  
//\Param - charString - character string  
//\Param - font_selected - Two full fonts (6 X 8, 6 X 16 and limited font 26 X 64)  
//\param _timeToWait is the time in milliseconds to wait for function to complete  
///  
//\return 0 on success, negative error code on failure  
// Possible error codes are:  
// NO_USB_DISPLAY_CONNECTED = No usb display is  
connected  
DLLDEF int DisplayString(unsigned char x, unsigned char line, unsigned char  
colour, char *charString, int font_selected, int _timeToWait);
```

## Bitmaps

The API has 3 functions that deal with the bitmap.

- DrawBitMapFromHost
- LoadBitMap
- DrawIconFromFlash

## Background

The bitmap image cannot exceed 128 X 64, below is the process for converting from bitmap (MicroSoft Paint – monochrome bitmap (1 bitmap per pixel) format) to the Storm USB display format. This data is then used in the above bitmap commands. Please note: The Configuration Utility allows the user to load/Display/set as splash icon an already created bitmap (1bpp MS Paint format). The utility converts from bitmap to Storm USB Display and loads the data to the display.

The bitmap data for the USB display is formatted with following criteria, for a 128 X 64 bit display, the screen buffer is of size 1024bytes. The screen buffer is direct representation of the LCD display and represented as follows:

### Screen Buffer

```

Byte 00 01 02 03 04 05 06 07 08 09 10 11 12 13 14 15 (16 bytes represents 128 bit horizontal)
      17 18 19 20 21 22 23.....
      .
      .
      .
      .
      .....126 127

```

The pixels in each byte is represented as follows:

```

Bit 7
    6
    5
    4
    3
    2
    1
    0

```

So to enable pixel at position (0, 0), bit 7 of byte 0 will be set to 1.

There are various free utilities available to help convert to this format. Please contact Storm for further information.

## Example Code

Below is an example code on how to use the USB Display API.

On request this source code can be downloaded. The following files are included :

- Visual Studio Project – TestApi
- TestApi.c - Source Code to test the UBDisplayApi
- Header files - All header files for above
- Debug - Debug Folder with USBDisplayApi.lib and hidapi.lib
- Release - Release Folder with USBDisplayApi.lib and hidapi.lib

The workspace also contains project settings for Eclipse under Ubuntu (Linux).

The version of Eclipse used is the Indigo version and currently the Linux version uses SDL library.

testAPI - demonstration project that includes and shows how to use the 'USBDisplayApi.lib' to communicate with the USB Display.

USBDisplayApi is based on the HIDAPI library which is a multi-platform library which allows an application to interface with USB HID-Class devices on Windows, Linux, and Mac OS X. The HIDAPI is encapsulated within the USBDisplayApi.lib and the developer should not be concerned with the usage of this library.

testAPI directory contains the project. The 'debug' and 'release' subdirectories of the project contain pre-built executables that are immediately usable for testing.

Also, this directory contains Visual Studio 9 project and solution that will build these executables directly.

The includes pre-built executables should demonstrate usage of the USB Display API.

This program simply demonstrate most of the API like draw circle, draw rectangle, draw string etc. It also displays the front panel key presses.

## Example Code 1

```

## Change History

Engineering Manual	Date	Version	Details
	10 Dec 13	1.0	First Release
	04 Mar 14	1.1	Typographical errors corrected
	14 Oct 14	1.2	Added Display Char and Display String Functions
		1.3	<i>Still need to add API changes and object library versions</i>
	05 Aug 15	1.4	Added multiple command in firmware to speed up the display text.
	05 Nov 15	1.5	Add splash screen p73 in API.

Device Firmware	Date	Version	Details
	05 Aug 15	6.0	Added multiple command to speed up the display text (9v06 Firmware on device – field upgradeable)
	05 Nov 15	7.0	Added splash screen control in API

Configuration Utility	Date	Version	Details
	10 Dec 13	1.0	First Release
	11 Mar 14	2.0	Production Issue ( 9v03 Firmware on device)

API Source Code	Date	Version	Details
	10 Dec 13	1.0	First Release (incl. Windows & Linux Libraries)
Visual Studio Project – TestApi	14 Oct 14	2.0	Speeded up refresh rate (in conjunction with device firmware 9v04)
TestApi.c - Source Code to test the UBDisplayApi			API extended to allow use with managed code.
Header files -All header files for above	10 Feb 15	4.0	Increased buffer size to allow whole screen refresh. Device Firmware now at 9v05 Added enable refresh flag in API
Debug - Debug Folder with USBDisplayApi.lib and hidapi.lib	05 Aug 15	5.0	Added Multiple Command support.
Release - Release Folder with USBDisplayApi.lib and hidapi.lib	05 Nov 15	6.0	Added splash screen control

This document is provided for use and guidance of engineering personnel engaged in the installation or application of Storm Interface data entry products manufactured by Keymat Technology Ltd. Please be advised that all information, data and illustrations contained within this document remain the exclusive property of Keymat Technology Ltd. and are provided for the express and exclusive use as described above.

This document is not supported by Keymat Technology's engineering change note, revision or reissue system. Data contained within this document is subject to periodic revision, reissue or withdrawal. Whilst every effort is made to ensure the information, data and illustrations are correct at the time of publication, Keymat Technology Ltd. are not responsible for any errors or omissions contained within this document.

This device complies with part 15 of the FCC Rules. Operation is subject to the following two conditions: (1) This device may not cause harmful interference, and (2) this device must accept any interference received, including interference that may cause undesired operation.

Note: This equipment has been tested and found to comply with the limits for a Class B digital device, pursuant to part 15 of the FCC Rules. These limits are designed to provide reasonable protection against harmful interference in a residential installation. This equipment generates, uses and can radiate radio frequency energy and, if not installed and used in accordance with the instructions, may cause harmful interference to radio communications. However, there is no guarantee that interference will not occur in a particular installation. If this equipment does cause harmful interference to radio or television reception, which can be determined by turning the equipment off and on, the user is encouraged to try to correct the interference by one or more of the following measures:

- Reorient or relocate the receiving antenna.
- Increase the separation between the equipment and receiver.
- Connect the equipment into an outlet on a circuit different from that to which the receiver is connected.
- Consult the dealer or an experienced radio/TV technician for help.
